1.1.2.1 Reading, Homeworks, Projects, SemProjects

- Readings:
- Homeworks
- Data Science Projects:
- 451 SemProjects:
- Friday Comm. Hour

1.1.2.2 Syllabus

License: CC-BY-SA 4.0

1.1.2.2.1 setup for r-code chunks

```
options("digits" = 5)
options("digits.secs" = 3)
```

1.1.2.3 A Simple Overview of R

We'll look in more detail, going forward

1.1.2.3.1 Intro to some R: Data Types

- Primitives (numeric, integer, character, logical, factor)
- Data Frames
- Lists
- Tables
- Arrays
- Environments
- Others (functions, closures, promises..)

1.1.2.3.2 Simple Types, and their class

```
x <- 1
class(x)
## [1] "numeric"

y <- "Hello World"
class(y)
## [1] "character"

z <- TRUE
class(z)
## [1] "logical"

as.integer(z)
## [1] 1</pre>
```

1.1.2.3.3 Simple Types - Vectors

The basic type unit in R is a vector

```
x <- c(1,2,3)
x
## [1] 1 2 3
x <- 1:3
x[1]
## [1] 1
x[0]
## integer(0)
x[-1]
## [1] 2 3</pre>
```

Figure 1: DSCI351-451 Syllabus

1.1.2.3.4 Generating Vectors

R provides lots of convenience functions for data generation:

```
rep(0, 5)
## [1] 0 0 0 0 0
seq(1,10)
## [1] 1 2 3 4 5 6 7 8 9 10
seq(1,2,.1)
## [1] 1.0 1.1 1.2 1.3 1.4 1.5 1.6 1.7 1.8 1.9 2.0
seq(1,2,length.out = 6)
## [1] 1.0 1.2 1.4 1.6 1.8 2.0
```

1.1.2.3.5 Indexing, c is concatenate

-to see the help on c: help(c)

```
x <- c(1, 3, 4, 10, 15, 20, 50, 1, 6)
x > 10
## [1] FALSE FALSE FALSE TRUE TRUE TRUE FALSE FALSE
which(x > 10)
## [1] 5 6 7
x[x > 10]
## [1] 15 20 50
x[!x > 10]
## [1] 1 3 4 10 1 6
x[x <= 10]
## [1] 1 3 4 10 1 6
x[x > 10 & x < 30]
## [1] 15 20</pre>
```

1.1.2.3.6 Functions, very easy to define

Usually take code in scripts, make functions from them

```
square <- function(x) x^2
square(2)
## [1] 4

pow <- function(x, p=2) x^p
pow(10)
## [1] 100
pow(10,3)
## [1] 1000
pow(p = 3,10)
## [1] 1000</pre>
```

Functions can be passed as data:

```
g <- function(x, f) f(x)
g(10, square)
## [1] 100

h <- function(x,f,...) f(x,...)
h(10, pow, 3)
## [1] 1000</pre>
```

1.1.2.3.7 R is Vectorized

Example - multiplying two vectors:

```
mult <- function(x,y) {
  z <- numeric(length(x))
  for (i in 1:length(x)) {
    z[i] <- x[i] * y[i]
    }
  z
}
mult(1:10,1:10)</pre>
```

```
## [1] 1 4 9 16 25 36 49 64 81 100
```

1.1.2.3.8 R is Vectorized

Multiplying two vectors 'the R way':

```
1:10 * 1:10
## [1] 1 4 9 16 25 36 49 64 81 100
```

```
NOTE: R recycles vectors of unequal length:

1:10 * 1:2
```

```
## [1] 1 4 3 8 5 12 7 16 9 20
```

1.1.2.3.9 NOTE: Random Number Generation

R contains a huge number of

- built-in random number generators
- for various probability distributions

```
# Normal variates, mean=0, sd=1
rnorm(10)

## [1] 0.75895 2.15695 -0.81204 -0.31848 0.57816 -0.42762 -2.16944

## [8] -2.78088 0.06828 0.21840

rnorm(10, mean = 100, sd = 5)

## [1] 99.842 99.044 101.398 104.492 100.761 98.973 96.839 105.450

## [9] 88.874 96.379
```

Many different distributions available (the \mathbf{r}^* functions)

1.1.2.4 Data Frames

1.1.2.4.1 Data Frames are fundamental

Data frames are the fundamental structure

- used in data analysis
- Similar to a database table in spirit
- (named columns, distinct types)

1.1.2.4.2 Data Frames can be indexed

Data frames can be indexed like a vector or matrix:

```
# First row
d[1,]
## x y z
## 1 1 AUDUSD one

# First column
d[,1]
## [1] 1 2 3 4 5 6

# First and third cols, first two rows
d[1:2,c(1,3)]
## x z
## 1 1 one
## 2 2 two
```

1.1.2.4.3 Generate a Data Frame

Let's generate some dummy data:

• Using data.frame

```
generateData <- function(N) data.frame(time = Sys.time() + 1:N,
    sym = "AUDUSD",
    bid = rep(1.2345,N) + runif(min = -.0010,max = .0010,N),
    ask = rep(1.2356,N) + runif(min = -.0010,max = .0010,N),
    exch = sample(c("EBS","RTM","CNX"),N, replace = TRUE))

prices <- generateData(50)
head(prices, 5)</pre>
```

```
## time sym bid ask exch
## 1 2018-08-27 18:49:11.790 AUDUSD 1.2336 1.2350 CNX
## 2 2018-08-27 18:49:12.790 AUDUSD 1.2352 1.2347 RTM
## 3 2018-08-27 18:49:13.790 AUDUSD 1.2352 1.2363 RTM
## 4 2018-08-27 18:49:14.790 AUDUSD 1.2351 1.2363 RTM
## 5 2018-08-27 18:49:15.790 AUDUSD 1.2349 1.2349 RTM
```

1.1.2.4.4 Data Frames

We can add/remove columns on the fly:

```
prices$spread <- prices$bid
prices$mid <- (prices$bid + prices$ask) * 0.5
head(prices)</pre>
```

```
## time sym bid ask exch spread mid

## 1 2018-08-27 18:49:11.790 AUDUSD 1.2336 1.2350 CNX 1.3844e-03 1.2343

## 2 2018-08-27 18:49:12.790 AUDUSD 1.2352 1.2347 RTM -4.4334e-04 1.2350

## 3 2018-08-27 18:49:13.790 AUDUSD 1.2352 1.2363 RTM 1.1567e-03 1.2357

## 4 2018-08-27 18:49:14.790 AUDUSD 1.2351 1.2363 RTM 1.1765e-03 1.2357

## 5 2018-08-27 18:49:15.790 AUDUSD 1.2349 1.2349 RTM -2.6734e-05 1.2349

## 6 2018-08-27 18:49:16.790 AUDUSD 1.2342 1.2363 RTM 2.1197e-03 1.2352
```

1.1.2.4.5 Operations on Data Frames

Some basic operations on data frames:

```
names(prices)
## [1] "time"
                                                  "spread" "mid"
               "sym"
                        "bid"
                                "ask"
                                         "exch"
table(prices$exch)
## CNX EBS RTM
## 14 11 25
summary(prices$mid)
     Min. 1st Qu. Median
                            Mean 3rd Qu.
                                            Max.
## 1.23 1.23 1.24
                            1.24 1.24
                                            1.24
```

1.1.2.4.6 Operations across data frame dimensions

Operations can be applied across different dimensions of a data frame:

```
sapply(prices,class)
## $time
## [1] "POSIXct" "POSIXt"
##
## $sym
## [1] "factor"
##
## $bid
## [1] "numeric"
##
## $ask
## [1] "numeric"
##
## $exch
## [1] "factor"
##
## $spread
## [1] "numeric"
##
## $mid
## [1] "numeric"
```

1.1.2.4.7 These Operators Are Functions

1.1.2.5 Examples in R

1.1.2.5.1 Example: Median Absolute Deviation

```
MAD(x) = median(|Y_i - \hat{Y}|)
mad
## function (x, center = median(x), constant = 1.4826, na.rm = FALSE,
##
       low = FALSE, high = FALSE)
## {
##
       if (na.rm)
##
           x \leftarrow x[!is.na(x)]
##
       n <- length(x)
       constant * if ((low || high) && n\%2 == 0) {
##
##
           if (low && high)
##
               stop("'low' and 'high' cannot be both TRUE")
##
           n2 <- n\%/\%2 + as.integer(high)
##
           sort(abs(x - center), partial = n2)[n2]
       }
##
##
       else median(abs(x - center))
## }
## <bytecode: 0x61015b8>
## <environment: namespace:stats>
```

1.1.2.5.2 Example: Simulating Coin Tosses

What is the probability of exactly 3 heads in 10 coin tosses for a fair coin?

Using binomial identity:

```
# $\binom{n}{k}p^{k}(1-p)^{(n-k)} = # \binom{10}{3}\left(\frac{1}{2}\right)^{3}\left(\frac{1}{2}\right) \cdots \cd
```

 ${\it Using binomial distribution density function:}$

```
dbinom(prob = 0.5, size = 10, x = 3)
```

[1] 0.11719

Using simulation (100,000 tosses):

```
sum(replicate(100000,sum(rbinom(prob = 1/2, size = 10, 1)) == 3))/100000
```

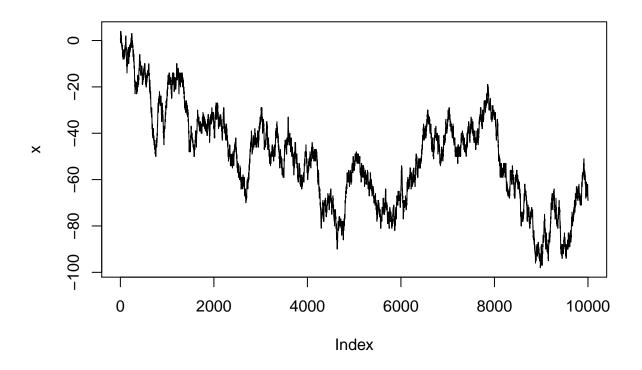

[1] 0.11742

1.1.2.5.3 Example: Random Walk

Generate 1000 up-down movements based on a fair coin toss and plot:

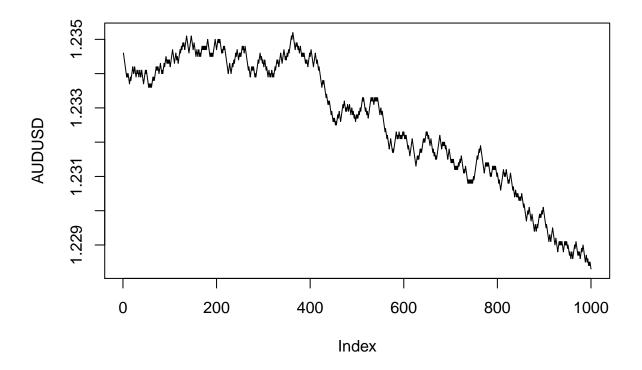

```
x <- (cumsum(ifelse(rbinom(prob = 0.5, size = 1, 10000) == 0,-1,1)))
plot(x, type = 'l', main = 'Random Walk')</pre>
```

Random Walk

1.1.2.5.4 Example: Generating Random Data

```
randomWalk <- function(N)(cumsum(ifelse(rbinom(prob = 0.5, size = 1, N) == 0,-1,1)))
AUDUSD <- 1.2345 + randomWalk(1000)*.0001
plot(AUDUSD, type = 'l')</pre>
```

1.1.2.5.5 Example: OANDA FX Data

```
require(quantmod);require(TTR)
EURUSD <- getSymbols("EUR/USD", src="oanda", auto.assign=FALSE)
plot(EURUSD)
lines(EMA(EURUSD,10), col='red')
lines(EMA(EURUSD,30), col='blue')</pre>
```

1.1.2.5.6 Example: Connecting to kdb+

• kdb+ is an online database of open time-series data

```
Rorys-MacBook-Pro:kdb rorywinston$ <b>./rlwrap q/m32/q -p 5000</b>

                                             EBS AUDUSD
```

1.1.2.5.7 Example: Connecting to kdb+

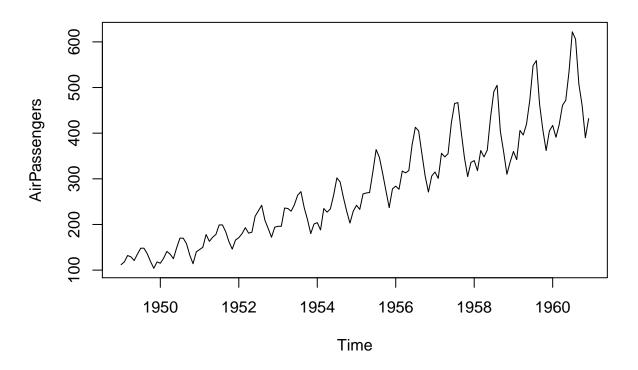

kdb+ datatypes are converted to native R types

1.1.2.5.8 Example: Reading Log Data From File

1.1.2.5.9 Example: Using already existing Datasets

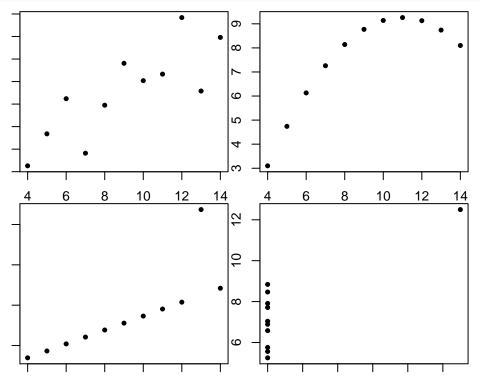

The famous 'Air passengers' dataset

```
plot(AirPassengers)
```

1.1.2.5.10 Example: Using Datasets:

• 'Anscombe Quartet':4 x-y datasets, same stats props, Yet quite different.
